

1. Computer memory: ~~is~~ means the capacity of computer to store document and activities. to see it again in future.

2 basic function of Computer memory: is to store data which is input by owner through input devices such as keyboard, camera, etc.

3 The Control unit of the central processing unit regulates and integrates the operations of the computer. It selects and retrieves instruction from the main memory in proper sequence and interprets them so as to activate the other functional elements of the system at the appropriate movement.

RAM is primary memory's example (Random access ~~to~~ memory).

Which is externally inserted in computer.

- * it stores data / documents for future use.
- * have high storage capacity
- * Can easily and fast access. ~~to~~
