Ans-2. A palmtop Computer was an IBM-Compatible electronic device that was about the size of a large pocket calculator. They came in a clamshell form factor, which allowed them to be used as a handheld device or what could be described as a small laptop computer. Although palmtop computers were based on Dos, many of them could run programs designed for traditional PCs. Today, palmtop computers are obsolete and no longer manufactured. If anything, the term used today would describe a smartphone or small tablet.

Ans- A vacuum-tube computer, now termed a first generation computer, is a computer that uses vacuum tubes for logic circuitry. Although superseded by second-generation transistorized computers, vacuum-tube computers continued to be built into the 1960s. These computers were mostly one-of-a-kind designs.
